

The graph above shows the actual ecological flow data-the amount of water left to the Paravani River from Paravani HEPP- for May 2017.

The minimum permitted ecological flow of Paravani HEPP is 1,75 m³/sec.

The increased flow for the date 5th, 10th and 15th of April was partially due to stops at generation, when no water was drawn to intake and partially due to seasonality effect, when the amount of water available at intake structure is more than the Project Discharge.

The increased flow for the other days was because of seasonality effect, when the amount of water available at intake structure is more than the Project Discharge.
