

The graph above shows the actual ecological flow data-the amount of water left to the Paravani River from Paravani HEPP- for April 2017.

The minimum permitted ecological flow of Paravani HEPP is 1,75 m³/sec.

The increased flow for the date 15th of April was due to stops at generation, when no water was drawn to intake.

The increased flow for the other days was because of seasonality effect, when the amount of water available at intake structure is more than the Project Discharge.
